Observaciones

Funciones simples (valores)

Funciones simples (vectorización)

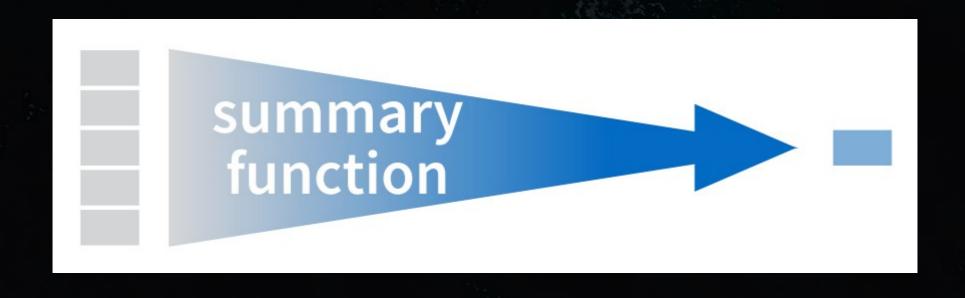

Vectorización

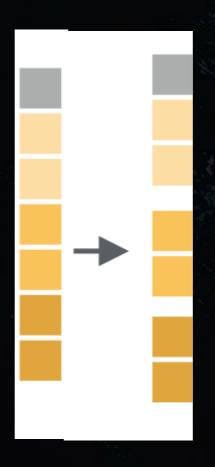

- R opera de forma "vectorizada"
- Si una función que normalmente opera sobre un valor la aplico sobre un vector, va a realizar la operación sobre cada elemento y devolver un vector

log(c(2, 45, 86))

Funciones de Resumen

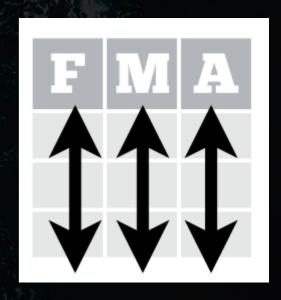

Categorizar una variable numérica

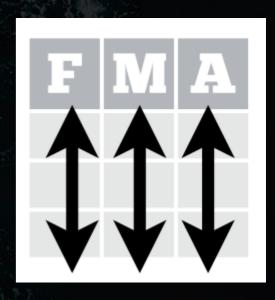

cut(datos\$temperatura, breaks=c(0,10,50,100), labels=c("frío","templado","cálido"))

Calculo nueva variable

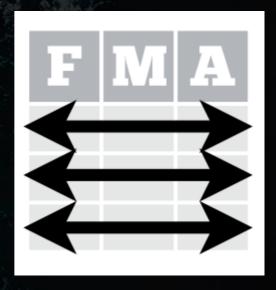

mutate(misdatos, T = F + M)

Selecciono variables

• select(misdatos, F, M)

Filtro según observaciones

• filter(misdatos, F < 10.2)

Paquetes: tidyverse
